

Model EC-C WINDOW BUBBLE

Custom Sized Square Style Bubble for Metal Window Wells

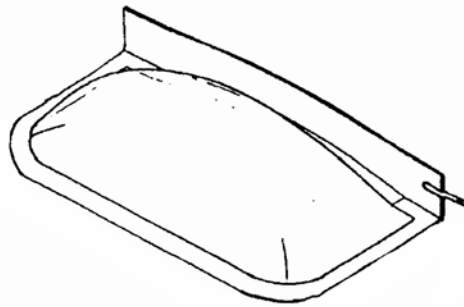

Model EC-C is used for square style metal basement area walls. These covers are custom made to fit your well. The cover is designed to rest directly on top of the metal window well and extend 1.25" beyond the well. There is a 4" flat flange on the back of the bubble, which is placed against the house wall. The Window Bubble dome is 4" to 5" high, which gives this unit its inconspicuous appearance and maximum load strength. A pattern of your well is required for this model to fit properly.

Special Circumstances

We do not advise drilling holes in this unit, either in the flange area or the bubble itself. Do not cut the bubble in any location without first calling our office for recommendations. If you have a dryer vent, wires or pipes extending from this well, we may recommend using a different type of cover for a proper fit.

Installation is Simple

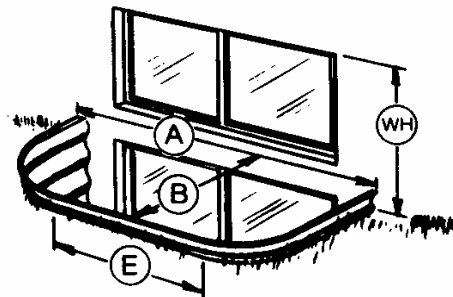

This model is fastened to the house wall with 2 aluminum pressure clips. We recommend one on each side on the back flange of the bubble. Place the clip at the desired location and mark the slot on the house wall. If the surface is concrete or brick, drill a 1/4" hole (1" deep) with a masonry drill bit. Insert the plastic anchor and screw the clip to the wall. Tighten until snug. **DO NOT OVER TIGHTEN.** Additional self-lock mushroom head fasteners are included with each unit, for easy removal. Check your local building codes for egress requirements before attaching the cover.

We Use Only High Quality Materials

The Window Bubble is formed from 3/16" PLEXIGLAS® Acrylic.

SQUARE STYLE WELL

Model EC-C Window Bubble covers custom sized square style metal wells.

NOTE: If this cover is being used as an egress cover, we highly recommend setting the cover in place over your well opening with no fasteners or using fasteners such to allow easy removal of the cover. Be sure to check your local building codes for egress requirements before attaching the cover.
